ABSTRACT

Sustainable livelihoods are dynamic in nature and also are influenced by external and internal conditions making the interdependent influencing factors more complex in nature. Inequitable access to livelihoods opportunities leads to social unrest and violence and political instability. Bishnupur district was purposively selected for present study. Multi- stage sampling procedure was followed for the selection of respondents. A sample size of 150 respondents was selected separately from each villages based on stratified random sampling with proportional allocation method. The study concluded that majority of the Islanders had medium level of livelihood on different aspects of sustainability factors. Age, family size, land holdings, annual income, animal enterprise intensity, nutrition, farm size, yield, technology utilization and economic motivation were the important factors which have contributed to the sustainable livelihoods gained by the Loktak Islanders. On regression analysis, the variables age, annual income, nutrition and yield were contributed significantly to prediction of sustainable livelihood and therefore is a good predictors for the sustainable livelihood of Loktak Islanders.

Key Words : Sustainable livelihoods; Human, Physical, Natural, Social and Financial capitals.

Agriculture and allied activities support livelihoods of nearly 70 per cent of India's rural population. In recent years, land based livelihoods of small and marginal farmers are increasingly becoming unsustainable, since their land has not been able to support the family's food requirements and fodder for their cattle. As a result, rural households are forced to look at alternative means for supplementing their livelihoods. The rapid changes at the macro level that India witnessed since the early nineties has contributed to the instability of the livelihood systems of the poorer

section of both rural and urban households. While the benefits of the globalization process have largely accrued to the urban sector growth the rural sector has been left behind. Slowdown in agricultural growth and productivity, changing cropping patterns, increase in distress migration, changing consumption patterns, government policies favoring industrial houses, among others have seriously undermined the food and livelihood security of the poorer households. An integrated, multidimensional and holistic approach to poverty eradication efforts is crucial to preserve and

enhance the livelihoods of the poor. A livelihood comprises the capabilities, assets and activities required for a means of living. It is deemed sustainable when it can cope with and recover from stresses and shocks and maintain or enhance its capabilities, assets and activities both now and in the future, while not undermining the natural resource base. The concept of sustainable rural livelihoods is increasingly central to the debate about rural development, poverty reduction and environmental management. Its idea was first introduced by the Brandt Land Commission on Environment and Development in 1987 as a way of linking socioeconomic and ecological considerations in a cohesive, policy-relevant structure. A sustainable livelihood approach is essentially a way of organizing data and analysis, or a “lens” through which to view development interventions. It has conceptual roots in various traditions, including applied social science, agro-eco systems/farming systems analysis and especially participatory approaches to rural development. Taking a holistic view of a project (need, focus and objectives), it provides a coherent framework and structure for analysis, identifies gaps and ensures that links are made between different issues and activities. The aim is to help stakeholders engage in debate about the many factors that affect livelihoods, their relative importance, the ways in which they interact and the most effective means of promoting more sustainable livelihoods. The strategy of sustainable livelihood is the way in which poor people deploy their assets and capabilities to improve their livelihoods i.e., consumption, production, processing, exchange and income-generating activities.

Loktak Lake, the largest freshwater lake in the North-Eastern region of India is considered as “The lifeline of the people of Manipur” due to its importance in the socioeconomic and cultural life. It has direct catchment area of 980 sq km and indirect catchment of 7157 sq km. Out of the 18,37,149 (as per 1991 census) populations of Manipur, about 12 Lakhs people are directly or indirectly benefited

from the lake. Most of the local people living around the lake depends upon the lake resources for their sustenance. The lake is rich in biodiversity and has been designated as a wetland of international importance under Ramsar Convention in 1990. The lake is featured by the presence of floating islands known as *Phumdis*. The largest single mass of phumdis (40 sq km.) constitutes Keibul Lamjao National Park, the only natural habitat of the endangered mammal, the Brow Antlered Deer (*Cervus eldi eldi*). Notwithstanding the importance attached to the livelihood options in the changing scenario, little extension efforts are made so far, lack of systematic efforts to draw lessons and develop insights into the livelihood options of the rural poor particularly, that of the Loktak islanders is the quite evident in the state. The present study was aimed to find assess to Sustainable Livelihoods of Loktak Lake Islanders in Bishnupur District of Manipur.

MATERIALS AND METHODS

In Manipur, there are nine districts. Bishnupur district was purposively selected for present study. In Bishnupur district, three sub-divisions are there, i.e., Nambol, Bishnupur and Moirang. The Island Thanga, under Moirang sub-division of Bishnupur district was selected purposively for the present study since the Islanders are considered to be the direct dependents and managers of the lake. Thanga Island consisted of 2- Gram Panchayat, i.e., Thanga Part-I and Thanga Part-II. 2-villages from Thanga Part-I Gram Panchayat having 5-villages and 3-villages from Thanga Part-II Gram Panchayats having 9-villages were selected purposively based on higher households among the villages. Multi-stage sampling procedure was followed for the selection of respondents. A sample size of 150 respondents was selected separately from each villages based on stratified random sampling with proportional allocation method.

RESULTS AND DISCUSSION

Determine the present sustainable livelihoods pattern of

Loktak Lake Islanders in Bishnupur District :

The concept of sustainable livelihoods is increasingly important in the developmental debate. In the present study the outlines of framework for sustainable livelihoods defined in relation to five key capitals which could be achieved through livelihood resources (i.e., human, physical, natural, social and financial capitals) which are combined in the pursuit of different livelihood strategies.

The table 1 shows that the farmers had poor access to health facilities (74.67%) followed by average (15.33%) and good (10.00%) health facilities. Majority of the Loktak Islanders were functionally literate (26.67%) followed by primary school (23.33%), middle school (16.67%), high school (12.00%), college (8.67%), illiterate (7.33%) and graduation (5.33%). Majority (87.33%) of the Loktak Islanders had undergone only one training programme followed by two trainings (6.67%), three trainings (3.33%) and each

of 1.33 per cent Islanders had six and eight trainings respectively. It was found from the table 1 that an average labour availability (64.67%) was observed followed by good (18.00%) and poor (17.33%) labour availability. Overall human capital shows that 52.67 per cent of the farmers had low human capital followed by medium (26.67%) and high (20.67%) human capital respectively.

Majority of the Loktak Lake Islanders (56.67%) had private transport for their local transport followed by public transport (42.00%) and bullock cart (1.33%) Findings in table 2 indicates that majority (76.67%) of the respondents were living in katcha house followed by dwelling in pucca house (12.67%) and tiled house (10.67%). Majority (54.67%) of the Loktak Islanders had poor water supply and sanitation followed by average (34.67%) and good (10.67%) drinking water supply and sanitation. The result in table 2 shows that majority (76.00%) of the Loktak Islanders were using firewood as principal source of energy for household

Table 1 : Distribution of respondents according to their Human Capital

Sr. No.	Items	Classification	Frequency	Percentage
1.	Health facilities	Poor	112	74.67
		Average	23	15.33
		Good	15	10.00
		Illiterate	11	7.33
2.	Education	Functionally literate	40	26.67
		Primary school	35	23.33
		Middle school	25	16.67
		High school	18	12.00
		College	13	8.67
		Graduation	8	5.33
		One	131	87.33
3.	Training(s) undergone	Two	10	6.67
		Three	5	3.33
		Six	2	1.33
		Eight	2	1.33
4.	Labour availability	Poor	26	17.33
		Average	97	64.67
		Good	27	18.00

Overall human capital

or domestic purpose followed by kerosene (18.67%) and LPG (5.33%). It was found that neighbours (25.33%) were found to be the main source of information source followed by local leaders (20.00%), newspapers (19.33%), radio (16.00%), television (14.00%) and Panchayat or society officials (5.33%). Table 2 reveals that slightly more than half (52.67%) of the Islanders had low material possession (possession of one material or animal) followed by no material possession (28.00%), only (16.00%) two farm animals (bullock cart or radio) and more material possession (3.33%) by Loktak Islanders. It was found that Overall physical capital (58.00%) of the Loktak Lake Islanders had low physical capital followed by

high (22.67%) and medium (19.33%) physical capital.

It is evident from the table-3 that majority of the Loktak Islanders (84.00%) were cultivating under wet land, whereas only 16.00 per cent were endowed with dry lands. It was found that majority (56.00%) of the Islanders cultivating under black soils type followed by red soils (23.33%), chalka (10.00%) and sandy soils (10.00%). The type of soils generally limits the type of crops to be cultivated, which may limit profit and better livelihood options. The data presented in table reveals that majority (58.33%) of the Loktak Islanders were mainly depending on the canals for irrigation followed by tanks (29.16%) and wells (12.50%). Majority (90.00%) were adopting fishery system and crop-crop

farming systems adopted by 10.00 per cent of the farmers. Table 3 indicates that overall natural capital of the Loktak Lake Islanders (46.00%) had low natural capital followed by medium (35.33%) and high (18.67%).

It was found that a vast majority (92.00%) of the Islanders had no socio-economic participation followed by 4.67 per cent with official position in self help groups (SHGs) and 2.00 per cent of the farmers involved in official positions in one or more formal organizations and 1.33 per cent involvement in the community work. Majority of the Islanders (46.00%) had medium trust followed by high (27.33%) and low (26.66%) trust. As regards to overall social capital majority of the Islanders (50.67%) had high social capital followed by medium (30.00%) and low (19.33%).

The data presented in table 5 that majority (52.67%) of the Loktak Islanders were fallen in indebt category of Rs.500-3,600 followed by Rs.3,601-6,700 (24.67%), Rs.9,801-16,000 (5.33%), Rs.6,701-9,800 (4.00%) and Rs.12,901-16,000 (2.66%). In case of savings less number of Islanders (6.00%) had savings Rs.240-2,972 and only 1.33 per cent Islanders had savings of more than Rs.1, 192-13,924. It was found that overall of the Islanders had low financial capital (52.67%) followed by medium (27.33%) and high (20.00%) financial capital. The findings were in

conformity with Rao, S. et al, (2007)

It may be observed from the values of coefficient of correlation presented in table-5 reveals that the variables viz., age, family size, land holdings, annual income, animal enterprise intensity, nutrition, farm size, yield, expenditure pattern, technology utilization and economic motivation were to be positively and significantly correlated to the sustainable livelihoods of Loktak Lake Islanders at 0.05 level of probability, but education, farming experience, urban contact, extension contact and achievement motivation were negatives and not significantly correlated to the sustainable livelihoods of Loktak Lake Islanders at 0.05 level of probability. Similar results were also reported by De Haan A, (2002), Acharya SK, et al (2012) and Chen H, et al Zhu T (2013).

All the 16 independent variables were taken for regression analysis. The findings of the analysis are presented in Table-7. Of the 16 independent variables fitted in regression analysis, 2 variables namely Annual income (X_5) and Yield (X_{10}) were found to have significant effect on the sustainable livelihood of Loktak Lake Islanders, the regression co-efficient being, $b=0.169, 0.888$ respectively. It was also inferred that with unit change in annual income (X_5) added to 0.169 unit changes in the value of sustainable livelihood, similarly a unit change in yield (X_{10}) has reflected

0.210 unit changes in the sustainable livelihood of Loktak Lake Islanders. It was observed that yield (X_{10}) emerged as the most significant characteristics ($b=0.888$) in predicting the sustainable livelihood of Islanders followed by annual income (X_5) with significant characteristics ($b=0.169$). The R^2 value (0.230) suggested that all the 16 independent variables jointly contributed 23.00 per cent towards the variation

in sustainable livelihood of Loktak Lake Islanders. The significant F value (2.487) at 0.01 level of probability indicated the significant effectiveness of the sixteen characteristics in determining the sustainable livelihood of Loktak Lake Islanders. This finding was found very similar to the finding of Reddy V and Ratna (2001), Rathod AR (2007) and Biradar B (2008).

CONCLUSION

The study concluded that majority of the Islanders had medium level of livelihood on different aspects of sustainability factors. Age, family size, land holdings, annual income, animal enterprise intensity, nutrition, farm size, yield, technology utilization and economic motivation were the important factors which have contributed to the sustainable livelihoods gained by the Loktak Islanders.

On regression analysis, the variables age, annual income, nutrition and yield were contributed significantly

to prediction of sustainable livelihood and therefore is a good predictors for the sustainable livelihood of Loktak Islanders.

Further, the Islanders were found to have benefitted fully or partially by the utilization of the naturally available flora and fauna of the Loktak Lake.
